

INTERNAL SEWAGE SYSTEM

ECO-ENVIRONMENTAL AND QUALITY DEVELOPMENTS

SYSTEM DESCRIPTION

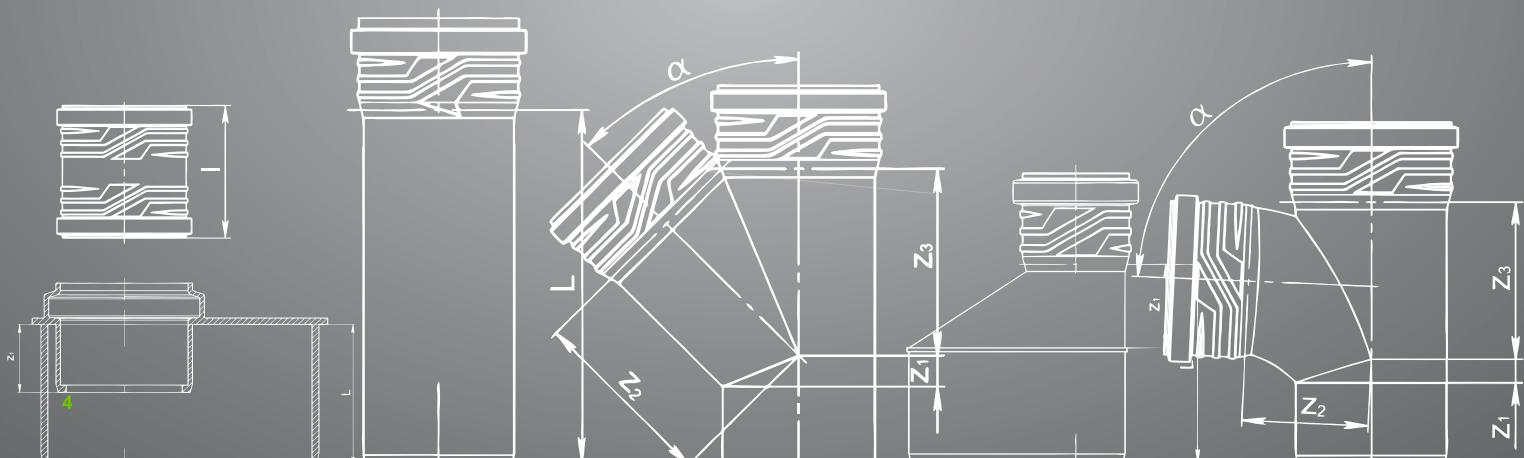

Internal sewerage ASG NANO HTR meets all modern requirements in residential and industrial construction. Features of the design of sockets give pipes and fittings increased rigidity and reliability.

Carefully selected high-quality raw materials provide high impact resistance, excellent noise insulation, long-term fire resistance according to DIN 4102 class B1, as well as trouble-free operation at high temperatures.

Description of the system	3

THE FIELD OF APPLICATION FOR SOCKET PIPES

The ASG NANO HTR internal sewage system is a universal product and has a wide range of applications, namely: installation and reconstruction of household, fecal, storm sewers, water for technological purposes, offshore pipelines, drainage and reclamation networks, tunnels for communications, tanks, wells, pontoons

ADVANTAGES

The internal sewage system from ASG NANO HTR has the following advantages:

- high quality
- attractive appearance
- soundproofing material for pipes and fittings (21 dB) which corresponds // to the degree of soundproofing;
- optimally smooth wear-resistant inner layer of pipes, reducing the risk of clogging;
- high resistance to ultraviolet radiation;
- high impact strength - resistance to mechanical stress during transportation, storage and installation.
- fire safety and fire resistance (according to DIN 4102 class B1);
- versatility - can be used in non-pressure and pressure systems (up to 6 bar), internal sewage systems;
- chemical resistance (used for aggressive environments in the range from pH 2 to pH 12).

Characteristic	Signs
Density (g/cm3)	1.1
Wick softening temperature (°C)	158-164
Thermal conductivity (W/K m)	0.22
Coefficient of linear thermal expansion (°C-1)	1,2* 10-4
Charpy impact strength (kJ/m2) (at 20°C)	6.86
Bending strength (N/mm2)	43,14
Yield point (N/mm2)	30,39
Tensile strength (N/mm2)	39.22
Elongation at break (%)	800
Modulus of elasticity (N/mm2)	1275
Color	Ral 7037

Elements of the ASG NANO HTR system are made of polypropylene homopolymer (PP-H) (according to DIN EN1451-1 and DIN 19560-10).

Two-piece seals are combined from two materials:

- thermoplastic elastomer;
- polypropylene

ASG NANO HTR is a new generation pipe designed for the construction of pipelines, the disposal of domestic and industrial wastewater and rainwater inside the building.

ASG NANO HTR pipes are made from an improved material formulation based on polypropylene and natural components, thanks to which they are distinguished by new beneficial properties that increase the functionality of the sewer. The heat-resistant stabilized polymer from which the system is made exhibits a very high resistance to the effects of various, including aggressive, chemical compounds and high and low temperature wastewater. The centimeter scale directly on the pipes makes the installation of the sewer system more comfortable.

The pipe is a development of the enterprise
«SAN TEH RAI» patent N ° 132230

PIPE MARKING:

ASG NANO HTR PP-H DN XXXXX LXXXXmm

Where:
1 - the value of the nominal diameter;
2 - the value of the wall thickness;
3 - the value of the construction length of the pipe;
4 - designation of the purpose of the product according to the method of application, according to EN 1451-1 (B - internal sewerage);
5 - flammability class according to DIN 4102;
6 - production batch number.

ASG NANO HTR fittings have a thoughtful design and attractive design.

To strengthen and increase the overall strength, the sockets of the fittings have a special profile.

Fittings are equipped with two-component O-rings. They are pre-installed at the factory.

Each fitting has its own marking. It includes information about:

- material;
- outer diameter;
- date of manufacture.

Type of product	AAAA	BBB	CC	DDD

Plug	STRM	40	-	-

Through the use of two-component O-rings, pipes and fittings can be installed in both pressure and non-pressure internal sewage systems. Two-piece O-rings are combined from two materials:

- thermostatic elastomer
- polypropylene.

Due to the carefully developed design and specially selected materials, the compounds have 100% tightness.

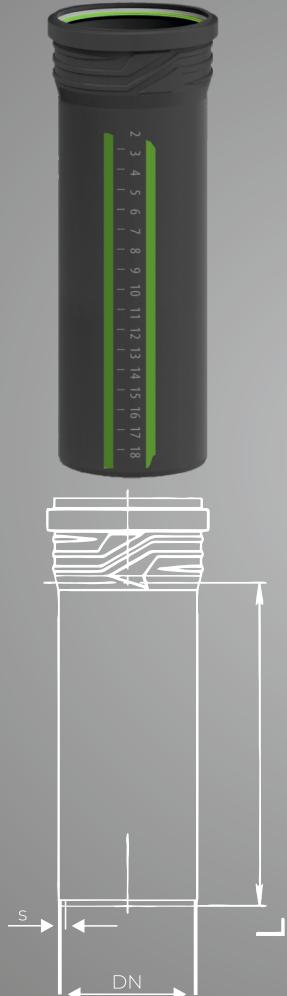

ASG NANO HTR sewer fittings and pipes are equipped with two-component sealing rings, which are pre-installed and lubricated on robotic lines.

The composition of the grease for sealing rings is the intellectual property of SAN TEH RAI

The substance has unique properties, which provide:

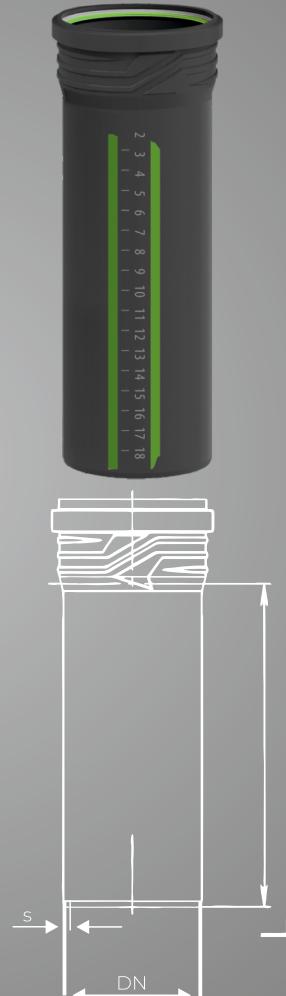

- Maximum slip and ease of installation.
- Retains its properties at temperatures from -40 to 95 °C.
- Provides the longest tightness of the connection.
- It is recommended to use this grease in countries with severe climatic conditions.

O-rings are the development of SAN TEH RAI, patent 40898

CONNECTING PIPES WITH FITTINGS

- Clean the O-ring, the inner surface of the socket and the end of the pipe from dirt.
- Check that the O-ring is installed correctly
- Lubricate the end of the pipe to be inserted with liquid soap (or a special lubricant) and insert into the socket until it stops
- In this position, make a mark with a pencil or felt-tip pen on the inserted end of the pipe along the edge of the socket.
- For long pipes (> 500 mm), push the plug-in end of the pipe 10 mm out of the socket to provide a gap to compensate for thermal expansion.
- For short pipes (< 500 mm) and fittings, push the insertion end of the pipe completely into the socket.

PIPING IN A BRICK WALL

The channels in the masonry should be made in such a way that the pipeline can be laid without internal stresses.

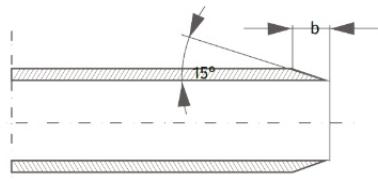

- Avoid sound-conducting bridges between the pipe and the wall.

If the pipes will be sealed without the use of reinforcing devices (for example, plaster or metal mesh) or without a sheath, then:

- Pipes and fittings must first be lined on all sides with flexible materials (mineral wool or thermal insulation)
- In the case of laying the foundation for plastering, the channel must first be covered. Due to this, when applying the plaster, it is possible to avoid the occurrence of sound-conducting bridges between the pipe and the masonry (wall).
- In places where, due to extraneous heat sources, the temperature may rise above 90 °C, pipes and fittings should be protected from overheating by means of additional thermal insulation

PIPE PROCESSING

Pipe cutting is done at a right angle with a pipe cutter or a fine-toothed saw. Burrs on cut edges must be deburred. The ends of the pipes must be chamfered at an angle of approximately 15°, as shown in the figure:

DN :	32	40	50	75	110	125	160
b (mm) :	3,5	3,5	3,5	3,5	4,5	5	6

Pipes must be transported on pallets or have at least one support along their entire length. Avoid direct blows to pipes, especially at negative temperatures.

Actions leading to mechanical damage should be avoided.

Pipes and fittings with installed O-rings can be stored outdoors, if possible, for no more than 3 years, taking into account UV protection.

During storage, pipe sockets must not be subjected to horizontal or vertical loads. The height of the stacks should not exceed 1.5 m.

CHEMICAL RESISTANCE OF PROPYLENE

Substances	Concentration %	Temperature °C		
		20	60	100
Acetone	100	+	0	
Aqueous solution of ammonia	10	+	+	
Pure amyl alcohol		+	+	
Acetic anhydride	100	+		
Benzene	100	-	-

PASSAGES THROUGH THE OVERLAPPING

Pipe penetrations through ceilings must be waterproof and soundproof. To do this, you can use a suitable lining of the passages in the ceilings.

If hot asphalt is laid on the floor: open sections of the pipeline must be protected with fireclay, protective pipe or wrapping with heat-insulating materials.

If fire-technical requirements are imposed on the ceilings, then it is necessary to provide fire safety measures.

PIPING

Pipes and fittings of internal sewerage systems ASG-plast can be concreted:

- sections of pipelines should be fixed in such a way as to prevent their length from changing due to thermal elongation during concreting.

- when laying the pipeline, ensure that sufficient expansion gaps are created.

- the gap in the socket must be closed with adhesive tape so that concrete does not penetrate there.

- before concreting, it is necessary to close the openings of the pipes.
